## PREFACE

The inventory of forest resourses of Mysore District was taken up during 1971-.73 by the Forest Survey of India, Southern Zone, Bangalore. The report highlights the details regarding area inventoried, methodology adopted, processing of the data and findings with regard to the forest resources of the district.

The net forest area of Mysore District is 3, 730,595 . $\mathrm{Em}, \mathrm{m}$. out of which tree forest area is 3, 498.06 5月.kms. Of the net forest area, $65.85 \%$ is coyered witt dense and moderately dense forest and 687.48 squms. is having open forest. To the extent of $95.09 \%$ of the erof composition is miscellaneous. The forest of the district has good representation of all the size classes containing $36.71 \%$ pole crop, $24.28 \%$ small timber. $10.4 \%$ big timber, 17.7 (\% mixed size class and $10.69 \%$ is regeneration crop. Regeneration is imadequate. The total number of stems of all the species in the forest area is about 5B. 22 millions which works out to an average of 166.45 stems/tia. The total standing volume in the tree forest area is about 18.86 million cutic metres, which works out to be 53.92 cutic metres per hectare. The growing stock is dominated by three species namély Anogeissus latifolia (17.3\%), Tectona grandis (13.47\%) and Termimalia crenulata (12.11\%). The bamboo forest of the district has the potential of producing 30,370 tonnes of bamboo each year. A large portion of bamboo stock (about 28.9\%) cansists of partialm ly dry and damaged culms underlyning the need for more intensive management of bamboo.

The inventory work was carried out by the field staff of the forest Sürvey of India, Southern Zone, Bangalore under the supervision of Shri M. Muni Reddy, Joint Director, and Shri Devendra Kumar, Deputy Director, The field parties were led by Shri K. S. Reddy, Jr. Technical Assistant, Shri G.5. Trivedi, Jr. Technical Assistant and Shri $S_{n}$ Sampath, Jr. Technical Assistant and the data processing was done by Shiri Madugani Dmpratiash Sr. Technical Assistant and Shri S. Sampath; Jr. Technical Assistant in $P C$ AT 286 using the software developed by southern zone, Bangalore. The cooperation and help rendered by the Karnataka forest Department at every stage is highly appreciated and thankifully acknowledged.

It is hoped that the report will be useful for foresters in planning developmental programes in forestry sector at different levels.

## APPENDIX

## SUMMARY

This refort deals with the inventory of forest resources of Mysore District carried out by Forest Survey of India, Gouthern .Zone, Bangalore from 1991 to 1993.

It includes the details of the area inventoried, methodology of data collection and its processing and analysis of the results. The salient features of the survey can be summarised below:
a)

Net forest area is 3730.59 km and tree forest area is 3498.06 kme $65.85 \%$ of the net forest area is covered with dense and moderately dense forest. 798.69 kmen area is having dense tree forest and 1658.04 kme. is containing moderately dense tree forests. 687.48 kme. area is having open forest.
b) The forest has been categorised into three strata, namely Teak, Bamboo and Miscellaneous and the latter forms $95.09 \%$ of the crop composition.
$61.26 \%$ of the area is having medium to deep soil and $38.73 \%$ of the area is covered with shallow to very shallow soil.
d) $45 \%$ of the area is devoid of humus layer.
e) $95.09 \%$ of the area containing natural forest of seed origin. 4.62\% of area is covered with man made forest.
f) The tree forest has good representation of all the size classes. It contains $36.71 \%$ pole crop, $24.28 \%$ small timber. $10.40 \%$ big timber, 17. $92 \%$ mixed size class and $10.69 \%$ regeneration crop.
9) Regeneration is absent in $20.52 \%$ of the area and is inadequate in $63.58 \%$ of the arean

1) The total number of stems of all species in tree forest area is $5,82,23,490$ which works out to an average of 166.45 stems/ha.
i) The total standing volume in the tree forest area is $1,88,60,869$ ma which works out to be $53.920 \mathrm{~m}^{3} /$ ha. About $43 \%$ of the growing stock is comfrised of three species namely Anogeissus latifolia ( $17.3 \%$ ), Tectona grandis ( $13.47 \%$ ) and Terminalia crenulata (12. 11\%).
j) The total green bamboo stock in the district is 1,37,844 tonnes. The average green bamboo stock works out to 1.39 tonnes per hectare.
k) The bamboo forest in the district have a potential of producing 30,370 tonnes every year.
2) 

A large portion of green bamboo stock (about $28.9 \%$ ) consists of dry and damaged culms, underlining the need for more intensive management of tamboo growing stock.

## CHAPTER - I

## BACK GROUND INFORMATION

1.0 The evaluation of forest resources both qualitatively and quantitatively is the essence of the forest inventory. The main objective of the forest inventory work is to collect qualitative and quantitative information on forest resources within optimum precision limits so that the data are useful in State and National level planning. The inventory taken $u p$ by the Forest Survey of India comes under the category of National Forest Inventories which require general estimate of all the elements of a forest inventory including the charasteristics of the trees, land on which they grow, estimation of growimg stock and estimate of growth and drain. All these details are necessary for effective resource management of our forest wealth.

The inventory of the forest of Mysore District was undertaken by the Forest Survey of India, Southern Zone, Bangalore during the year 1971-1793. The field work was started in December, 1991 and was completed in March, 1793. The design followed in the survey is Systematic Cluster Sampling selected in a random manner.

## LOCATION:

The survey area consists of entire Mysore district lying between $11^{\circ} 30^{\prime}$ and $12^{\circ} 50^{\prime}$ North latitudes and $75^{\circ} 45^{\prime}$ and $77^{\circ} 45^{\prime}$ East longitudes. It is situated in the Southern part of Decan Peninsula and forms the Southern most part of the Karnataka State. It consists of 11 Taluks and

## MAP OF KARNATAKA

obrtriet He.

INVENTORIED AREA $\square$
Omangalore PRADESH

5 Forest Divisions mamely Mysore, Kollegal, Chamıajnagar and Hunsur (fart) and Bandipur Tiger Project area. It is bounded on the North by

Hassan and Mandya Districts, on South by Cannanore District of Kerala State and Udhagamandalam (Nilgiri) District of Tamilnadu, on the East by Salem and Coimbatore District of Tamilandu and the west by Kodagu district of Karnataka.

### 1.2 PHYSICAL FEATURES:

Physiographically the region in which the district is situated may be classified as partly maidan and partly semimalnad. The ground is generally undulating and the land of the district forms an undulating table land with granite rocks protruding at odd intervals. The primeipal range of hills are the Eiligirirangana betta in Yelandur Taluk and the Male Mahadhestiwar hill in Kollegal Taluk; the former rising to a height of 5090 feet ( 1697 mietres) ahove the sea level.

The extreme South forms a terrain of dense forests and the major portion of the land here is uniformly covered by red loamy soil. The Western Taluks are bounded by the lofty mountain ranges of the western Ghats. The main forest area are located in the Southern and SouthWestern Taluks of Kollegal, Yelandur, Chamrajnagar, Gundulpet and Heggadadevan Kote, Periyapatna and Hunsur.

The drainaye is towards East and comprises mainly the Cauvery river basin besides those of Kabini, Lakshmanthirtha and Suvarna Kote which are tributaries of Cauvery.

The Mysore District is endowed with rich wild life which is very clear from the fact that it supforts two National Parks i.e. Nagarahole and

Bandipur Tiger Reserve and Six Sanctuaries viz. Cauvery Wildife Sanctuary, B.R.T. Hills Sanctuary, Ranganetfitoo Sanctuary, Nugu Wildife Sanctuary and Aravithittu Sanctuary. The total extent of area under these National Parks \& Sanctuaries are approximately 2250 square kilometres.
. The major fauna that is abundant in the National Parks and Sanctuaries are Elephants, Bisons. Tigers and Panthers. Apart from this Ranganathitoo Bird Sanctuary attracts huge number of rare bird species and becomes an major attraction for the tourists coming to Mysore.

### 1.3 FORESTS:

The forests of the district is mixed and fall under the broad classification of South Indian Tropical Forest of Deciduous types. Evergreen type is also noticed in the Eastern portion of the District. As per Champion \& Seth's classification, the forest of the district falls under the following categories of forest types.

```
1. Southern Tropical Evergreen Forests ( \(1 \mathrm{~A} / \mathrm{C}_{3}\) ).
2. South Indian Tropical Moist Deciduous Forests(3B/Ce).
3. Southern Tropical Dry Deciduous Forests (5A/Ce).
4. The Scrub Forest (5B/DS \({ }_{\mu}\) - Dry Deciduous Scrut Champion \& Seth).
```

The higher elevation of Kollegal Range near Bellaje are charatterised by the existence of Evergreen Type of Forests. The forests mainly oceur in the valleys of these high hills and are surrounded by grass lands forming almost the 'shola' type of vegetation. The species commonly met are- Artocarpus hirsuta, Artocarpus integrifolia, Bischofia
javanice, Canarium strictum, Cinnamomum species, Aglaia roxhurghiana,

Elaeodendron glaucum. Evodia roxburghiana, Garuga pinnata, Lingustrum Species, Mecaranga roxburghiig Litsea lingustrina, Mangifera indica, Machilus macrantha, Mesua ferrae, Michelia champaca, Nephelium longana, Odina wodier, Qlea glandulifera, Palaguium ellipticum, Polyalthia species and Vitex altissima.

Moist deciduous forest is common in Western and Southern region of the district. The forests towards the western side aremore moist and are typical of the moist typen The chief species that are found are Tectona grandis, Dalbergia latifolia, Lagerstroemia lanceolata, Ierminalia tomentosa, Pterocarpus marsupium, Anogeissus latifolia, Grewia latifolia, Terminalia paniculata, Mangifera indica, Cassia fistula, Altizzia lebbet, Altizzia odoratissima, Shorea taluran

Both types of common bamboo viz. Bambusa arundinacea and Dendrocalamus strictus occur as under storey.

The common undergrowth is characterised by the presence of Helicteres isora, Lantana camera and Pterolobium indicum, Euptiatorium species.

Dry Deciduous type is characterised by foor site quality with shallow hard soil, relatively low rainfall and stunted growth of trees with open canopy. A fair good proportion of the total forest areas of the Mysore District falls in this type only. Main species found under this type are - Santalum album, Tectona grandis, Anogeissus latifolia, Pterocarpus marsupium, Dalbergia latifolia, Grewia tiliaefolia, Altizaia lebbek: Albizzia amara, Acacia leucoptioea, Acacia sundra, Dalbergia

Raniculata, Terminalia belerica, Schleichera gleosa, Shorea talura, Hardwickia binata, Chloroxylon swietenia, Gyrocarpous species, Bauhinia racemosa, Diospyros montana, Diospyros melanoxylon, Zyzyphus Eylopyra.

Thorny scrub type exists in the low lying areas of the hills on the Kollegal plateau, Heggadadevana Kote, Punjus and Chamrajnagar and Hunsur Range. It is associated with poor rainfall and impoverished soil devoid of humus. Good size trees are very few and occasionally found. The trees have very poor growth and are bushy in nature due to heavy grazing, browsing, repeated fires and indiscriminate cutting by men. The vegetation comprises of species like Shorea talura, Santalum album, Terminalia shebula, Anogeissus latifolia, Azadiractita indica, Albizzia lebbek, Chloroxylon swietenia, Acacia leucophloea, Acacia catechu, Acacia sundra, Steriospermum chelenoides, Boswellia serrata, Diospyros melanowy= lon, Dalbergia paniculata, Dalbergia latifolia, Dendrocalams strictus, Pterocarpus marsupium, Terminalia belerica, Zyzyphus Eylopyra.

### 1.4 CLIMATE \& RAINFALL:

The climate of the district is moderate throughout the year.
The temperature from November to February ranges from $16.7^{\circ} \mathrm{C}$ to $31.3^{\circ} \mathrm{C}$ while that in Summer (March to April.) ranges from $19.7^{\circ} \mathrm{C}$ to $35.1^{\circ} \mathrm{C}$. The Rainy Season is from June to October: There is extreme variation in the rainfall from locality to locality. The average rainfall varies from 1200 mim. in the Western region to 690 mm . in the Eastern region. The average rainfall for the whole district comes to 900 mm . approximately. The portion of Chamrajnagar and Kollegal Division receives rainfall both from South West monsoon and North East Monsoon. The South West monsoon precipitation is heavy and continuous and North East monsoon is lighter and intermittent in the areas of Kakanakote, Begur and Aini Marigudi Ranges in Chamajnagar Forest Division. In Kollegal Forest Divisioin

South West Monsoon does not precipitate considerably.

### 1.5 AREA \& POPULATION:

As per 1991 Census the total area of the district is 11954 sq.kma with a total population of 31,65018 . $70.3 \%$ of the inhabitants of the district live in rural areas. It has density of popoulation of 265 per sq.km. It has decennial growth rate of population as $21.57 \%$, Sek ratio 953 (Rural 958, Urban 943). literacy $40 \%$. The proportion of main workers to total population is $37.44 \%$ out of which $33.74 \%$ are cultivators, $27.89 \%$ are agricultural labourers, $2.82 \%$ are workers in household industry and $31.55 \%$ are other worteers.
1.6 LAND USE PATTERN:

The following table shows the land use pattern in Mysore District:

| 9.No. | Land use | Area in \% of total kme. land use. |  |
| :---: | :---: | :---: | :---: |
| 1. | Geographical area (accerding to village papers). | 12,460 | 100\% |
| 2. | Forest area | 3,380 | 27\% |
|  | LAND NOT AVAILABLE FOR CULTIVATION |  |  |
| 3. | Land fut to non agricultural uses | 860 | 7\% |
| 4. | Barren and uncultivable land | 670 | 5\% |
|  | OTHER UNCULTIVATED LAND EXCLUDING FALLOW LAND. |  |  |
| 5. | Permanent pasture and other grazing lands. | 920 | 7\% |
| 6. | Land under miscellaneous free crops and groves not included in the net area. | 110 | 1\% |
| 7. | Cultivable waste | 340 | 3\% |
| 8. | Fallow lands | 1,370 | 11\% |
| 9. | Net area sown | 4,810 | 39\% |
|  | Total | 12,460 | 100\% |

[^0]
### 1.7 OTHER SOCIO- ECONOMIC CONDITIONS:

The per capita land availability for cultivation in this district is 0.49 ha. Majority of the land holdings fall under small (1-2 ha.) and marginal (below 1 ha.) categories.

Rice and Ragi are the most important foodmyrains produced in the district. It ranks thirdamong rice producing districts of the gtate. It accounted for $10.3 \%$ of the total rice out put in the State and $10.9 \%$ of Ragi production of the State during 1991-92.

This district is known for mulberry cultivation and production of silk, Mysore silk sarees is famous item of production. Silk weaving factory is also located in the district. There are practically no mineral based industries in the district. However, the M.M.Hills in Kollegal Taluka is famous for Black Granite of export quality. The Government Company, Mysore Minerals are extracting granites from this locality apart from private enterfreneuers. The district is cent fercent electrified. As per 1991 Census, $40 \%$ of the population of the district is literate, $(30.2 \%$ of the rural people and $63.5 \%$ of the urban feople comes under literate category).

The district being the thirdrishest district in the forest wealth in the State, the forest provides raw material for industries like paper. rayon, sawmills, safety matches, sandal wood oil and agarbatti factories located in and around the district.

## CHAPTER - II <br> DESIGN \& METHODOLQGY OF THE SURVEY

2.0 The toposheets prepared by Survey of India is tatien as base map for carrying out inventory work. The scale of the map used was 1:50,000. In these maps the extent of forest areas was shown in green colour. The
 intervals which forms our basic sampling units. Data was collected from the two plots of 0.1 ha. falling in each grid only in forest areas.. Thus, the sampling design adopted was a CLUSTER SAMPLING, in which grids have been taken as cluster. Actually the sampling design was cluster sampling of unequal size because of the fact that in many grids only one plot was laid out.
2. 1 FQREST AREA DEF INED:

The following categories of lands were treated as FOREST AREA for the purpose of the forest inventory:
i) All those areas shown in green wast on Survey of India toposheets.
ii) All such areas in which words such as thick jungle, thick: forest, dense jungle, open forest with bamboo etce are mentioned.
iii) All those areas indicated by dotted line or spotted line or a pillar line as FDREST AREA.

After dividing the toposheet of $1: 50,000$ scale into 36 grids of 21/2' $x$ E1/2' each; the length ' $x$ ' and width ' $Y$ ' of each grid
was measaured to the smallest convenient scale. The length (d) of the side of the plot on the map corresponding to 0.1 ha, of square plot in the ground was calculated. After substracting the side `d" from length and width of the $\mathrm{g}^{\prime} \mathrm{id}$, the number $X^{\prime}=(X-d)$ and $Y$ ( $=(Y-d)$ was obtained. From the random table, two numbers in the range of 0 to $X^{\prime}$ and 0 to $Y$ were selected. Let it be $\mathrm{P}_{1}$ and $\mathrm{Pa}_{\mathrm{z}}$. To these numbers half of the plot side (d/2) was added to get $x$ and $y$ comordinates of the first plot centre considering left hand bottom ( $S-W$ ) corners of the grid as the origin. To get the centre of the second plot in the same grid, the centre of the first plot was joined with grid centre and is extended in the opposite direction upto the distance equal to distance between the grid centre and the first plot centre. This point became the centre of the second plot.

Qualitative and quantitative data were collected from the sample plots falling in the forest areas only. The data regarding terrain, soil, tree canopy and bamboo etc, were collected. Qualitative data sauch as forest types were collected by obtaining 2 ha, area surrounding the plot centre.

### 2.3 METHODOLDGY:

The field data was collected by three field parties each headed

DIAGRAM -2
DIAGRAM SHOWING MARKING OF PLOT IN $2 / / 2^{\prime} \times 21 / 22^{\prime}$ GRID
' $x$ ' a 'r' are the distances along ' $x$ a a ' $y$ ' AXES WITH SW CORNER AS THE ORIGN
$70^{\circ} 30^{\prime}$

DIAGRAM-I
DIAGRAM SHOWING IDENTIFICATION OF GRIDS ON I:50,000 OR 1:63,360 SCALE TOPOSHEETS
by Junior Technical Assistant who worked as Crew Leader. The crew leader was assisted by two fieldmen. The services of camp khalasai and unskilled labourers engaged locally on Muster Roll were also utilised. The crew leader was provided with camp equipments, a set of toposheets and
instruments used in survey wort such as silva compass, tilumeleiss hypsometer, caliper and measuring tape etc.

The camp locations were decided by the Crew Leaders based on the number of plots to be tackled from that locality. After selecting the plots to be surveyed on the day, the crew leader along with his crew members and the local forest staff proceeded to reference point located on tofosheet which could be identified on the ground. After reaching the reference point, the crew leader took the bearing of that reference point and measured the distance of the plot centre from that point on toposheet. The crew leader proceeded to the plot centre traversing the same distance in the same direction as indicated fromthe bearing of the reference point.

After reaching the plot centre, a square plot of 0.1 ha. with diagonal measuring 44.7E metres in NS-EW direction was laid on the ground. The required data was collected from the plot in the following prescribed forms. The sketch showing lay out of the plot on the ground is appended in the reportn
(i) PLOT APPRDACH FDRM:

This is filled by the Crew Leader when he starts from the canf to the sample plot and returns to the campe It is not used in dataprocessing. Only it is used in locating the plot during remsurvey iñfuture.

By observing 2 ha. around the plot centre, the qualitative data such as land use, tree crops composition and its density, erosion status, intensity of fire and grazing, regeneration status, bamboo data etc. are recorded.in the form.

## (iii)

## PLOT ENUMERATION FORM:

The trees and bamboo in 0.1 han plot are enumerated and recorded in the form. The trees with 10 cm. diameter and above at breast height over bark only are enumerated. The dead trees of having utility less than $70 \%$ are not enumerated. The diameter of a bamboo clump is measured at its base.
(iv) SAMPLE TREE FORM:

This is filled after filling the filot enumeration form. The data of trees with diameter 10 cm. and above at BHOB are collected from 1/4th. of the total plot, starting from N-W quadránt. For each sample tree, diameter at breast height, bark thickness, tree height, length of clear bole, form of tree etc. are recorded. Abstract of this information is written on the Sample Tree Card which is nailed to the respective tree. This facilitates the supervising officers for checking.

## (v) BAMEOO ENUMERATION \& CLUMP ANALYYSIS FQRM:

- The data of individual culms occurring in the selected clumps are recorded in this form. The clumps bearing serial No. 1, 9, 17, 25, 33 etc. (first and every eighth clump thereafter) of each bamboo species
are selected for detailed analysis. The mumber of tamboo culms fer clumf classified on the tais of age, greenness and soundness are recorded.

## (vi) BAMBOD ENUMERATION FORM (NOM clump forming):

In this form information is collected for non-clump forming bamboos ococurring in the sample plot. For the purpose of counting the culms only $1 / 8 \mathrm{th}$. area of the sample plot touching northern semidiagonal is taken. Counting is done in 1/E NW quadrfant only ine
in 0.0125 ha. Culmare classified on the basis of soundness, age and green-ness.

## (vii) BAMBOD WEIGHT FORM:

For determining the correlation between green and dry weight of the utilizable length of bamboo culm, sample pieces of matured culms are cut and weighed at regular intervals of time tilla constant air dry weight is obtained. The green weight of utiliagble culms of different dia class ( $2<5,548$ and 8 and above) and that of 30 cms. $10 n g$ pieces obtained in each from the top, middle and bottom fortions of the utilizable culms fromeder dia classes are recorded in this form.

This formis filled up for plots in which bamboo have been found in 2 ha. areas in and around the plot. Specimen of the above field forms have been given in Appendix.

A total of 391 sample plots were marked on the toposheets in the forest areas of Mysore District. The total entent of forest area depicted on the Survey of India toposheets was estimated by using the dot-grid method. The total forest area came to be about 3953.51 kmen Hence, area represented by each sample plot i.e. Area Weightage $=3953.51 / 391=$ $10.11 \mathrm{~km}^{\mathrm{E}}$.

Even though certain plots selected is shown as green wash area having forest cover in toposheet, it was seen after visiting the plots that about 2 ef plots were put under non forestry use. Dut of e2 flots, 20 points were under agriculture, one under barren lands and one under hatitation.

Thus the net forest area comes to (391-22) $\times 10.11=369 \times 10.11$ $=3730.59 \mathrm{~km}{ }^{2}$. The data pertaining to 369 plots were recorded. The intensity of survey has been calculated in the following manner:

1. Total extent of forest area sampled=3730.59kme $=373059$ ha.
2. Total area of the sample plots $=369 \times 0.1 \mathrm{ha}=36.9 \mathrm{ha}$.

$$
\text { Intensity of the survey }=\frac{36.9}{3,73.059} \quad \times 100=0.00989=0.01
$$

### 2.5 DIFFICULTIES ENVISAGED DURING THE FIELD WORK:

(a) Due to heavy infestation of wildelephants in groups, the field party was not in a position to tave an aceess to eight sample points.
(b) Forty five plots in Kollegal Taluk coiuld not be tackeld due to the sensitiveness of the area where Sandal Wood-Cum-Elephant Poacher Veerappan*s gang was in operation. The forest authorities as well as Special Task Force headed by Police Officers had advised not to enter to this area which being the core area for their activjities.

Thus, in ali 53 plots were extraploated with nearest sample point to get inventory result for the entire district.
(c) In thirteen plots our field parties could get access to the plot but could not reach upto the plot centre because of reasons mentioned in (a) and (b).
2.6 PLOT STATUS:

The details of the plot status are:

## CHAPTER -III

## dATA PROCESSING

## 3.0 <br> PREPARATION DF DATA FOR PROCESSING IN COMPUTER:

The basic field inventory data recorded in the field forms were checked at Zonal office to detect any inconsistencies and the corractions were effected where-ever necessary. The checked data were entered into the PC AT 286 Computer for processing. A computer programme was developed to produce the desired out put. The output was tabulated in the desired format.

3
3.1 . AREA CDMPUTATION:

The extent of the forested area as depicted on the Survey of India toposheet was calculated in the Zonal Dffice with the help of a dot grid method. The area of forests under various categories such as forest type, soil erosion status, grazing incidence, fire incidence, canopy density classes etc. was calculated by multiplying the number of sample plots ococurring in that class by the area weight of each sample point.

### 3.2 VOLUME ESTIMATION:

Felled tree data were not collected for preparation of generalvolume tahle. Sample tree data were not sufficient to develop local volume equations. Therefore, volume equations developed by FAO during the Pre-
investment Survey of Forest Resources of Southern Zone in the year 196768 have been adopted for volume estimation.

For Teak, Boswellia serrata, Diospyros melanoxylon and rest of the species, volume equations developed for Adilabad (A.P.) area have been used.

For Santalum album and Hardwickia binnata, the formula developed for rest of the species in Mahboobnagar (A.P.) survey has been used.

The following are the volume equations used for different species:

1. Anogeissus latifolia

$$
v=0.289-2.653 D+11.771 D^{2} .
$$

2. Dalbergia latifolia

$$
v=0.296-2.829 D+12.207 D^{2} .
$$

3. Lagerstroemia lanceolata

$$
v=0.07-1.295 D+9.429 D^{2} .
$$

4. Pterocarpus marsupium

$$
v=0.07-1.295 D+9.429 D^{2} .
$$

5. Schleichera trijuga

$$
v=0.023613-0.531006 \mathrm{D}+6.731036 \mathrm{D}^{2} .
$$

6. Tectona grandis

$$
v=0.023613-0.531006 \mathrm{D}+6.731036 \mathrm{De} .
$$

7. Terminalia tomentosa/crenulata

$$
v=0.289-2.653 D+11.771 D^{2}
$$

8. Terminalia paniculata

$$
V=0.07-1.295 \mathrm{D}+9.429 \mathrm{D}^{2}
$$

9. Vitex altissima

$$
V=0.289-2.653 D+11.771 D^{2}
$$

10. Diospyros melano:ylon

$$
V=0.024814-0.578532 D+6.110170 \mathrm{D} 2
$$

11. Boswellia serrata

$$
V=-0.076369+0.710215 \mathrm{D}+0.497600 \mathrm{D}^{\mathrm{E}}+11.38700 \mathrm{D}^{3}
$$

12. Grewia tiliaefolia

$$
V=0.070-1.295 D+9.429 D^{\underline{2}}
$$

13. Santalum album

$$
V=0.058 \quad 4.598 D^{3}
$$

14. Hardwictia binnata

$$
V=0.058+4.598 D^{3}
$$

15. Rest of the species

$$
V=0.088183-1.490948 \mathrm{D}+8.984266 \mathrm{D}
$$

CWhere $D=$ Diameter at breast height in metre over bart:
$V=$ Volume (excluding bark) in mis)]

### 3.3 ENUMERATED TREE VOLUME AND PLOT VOLUME:

By feeding the data of diameter at breast height ouer bark of
each enumerated tree in the volume equation, the individual tree volume of that particular species in a plot was found. By simple summatioin the
total volume of all the trees in the plot is determined. By addin! the Filot volume of all the plots in each strata (forest type) and by dividing by the total number of filots so surveyed we arrived at the average volume per plot. By multiplying the average volume per plot by a factor of ten we got the volume per ha. in that strata. This data was stored in the treefplot volume file.

### 3.4 STAND TABLE:

The elements of the tree/plot volume file were utilized to classify the tree by species, diameter, crop composition etc. The estimates of the number of stems per ha. and total stems by sfecies, diameter classes were obtained for each crof compositioin and was given in computer outFut.

### 3.5 STOCK TABLES:

The estimates of volume per hectare and total volume by species and diameter classes were obtained for each crop composition fromi the tree/plot volume file and were given in computer output.

### 3.6 STANDARD ERRDRS :

In order to estimate the sampling error, the sample was considered of unequal size, since in many grids only one plot was enumerated. Therefore, ratio method of estimating sampling error has been used.

$$
\bar{x}=1 / \pi \cdot \sum_{1=1}^{n} x_{1}=\text { Average No of plots fer Grid }
$$

Estimate of Variance of $R$

$$
V(R)=\frac{1}{n(n-1) X_{X}^{2}} \sum_{1=1}^{n} Y_{1}^{a}-2 R \sum_{1=1}^{n} X_{1} Y_{1}+R_{i=1}^{n} \sum_{1=1}^{m}
$$

Estmate of the Standard Error (SE) of R

$$
S E=\sqrt{v(R)}
$$

$$
S E \%=\frac{S E}{-} * 100
$$

where

$$
\begin{aligned}
n= & \text { Total No of grids in the sample. } \\
Y_{\perp}= & \text { Sum of the per Hectare volume/ stemin the ith } \\
& \text { grid ine the sum of fer hec volume/stem of each } \\
& \text { plot in that gride(per hectare volume/stem is } \\
& \text { calculated by summing the vol/stem of each tree in } \\
& \text { a plot then multiplyingit by 10.) } \\
x_{\perp}= & \text { Number of plots in the ith grid. }
\end{aligned}
$$

Standard errors have been estimated, for the growing stock in

### 3.7 BAMBD日: <br> 3.7 .1 <br> AREA:

The occurrence of bamboo was examined in an area of about 2 ha. around the plot centre and its density and quality were recorded in the plot descriftion form. By applying the area weight of the plot, the area under bamboo was estimated. Area under each quality bamboo was also estimated from the number of plots falling in each quality.

### 3.7.2 CLUMPS PER HECTARE:

The bamboo clumps ococurring in each sample plot were enumerated by species and diameter of the clump. This information was utilized for assessing the number of clumps fer han by species and clump size class. Separate estimate for each species were obtained. To estimate the number of clumps fer han in each quality and clump size class, the data of plot description forms and plot enumeration forms were merged together.

### 3.7.3 CULMS PER CLUMP:

In every eighth clump starting with the first clump in a sample plot the number of culms by age and soundness was enumerated and record ed. The culms were further classified by culmediameter class. This information was used for estimating the number of culms per clump in different classes.
3.7.4 CULMS PER HECTARE:

The estimates of the number of clumps per ha. and the number of
culms per clump gives the number of culms per ha. under different classes of each species.

### 3.7.5 TOTAL NUMEER OF CULMS:

The estimates of the number of culms fer hectare and the extent of area under specific quality classes gives the total mumber of bamboo culms in the inventoried area.

### 3.7.6 BAMBDD STOCK:

Weight of the utilizatle length of green culms of diameter 2 to 5 cma 5 to $8 \mathrm{cmm}, 8$ [mi and above, were recorded by felling bamboo culms from the first clump in each plot. Average green weight of a culm was thus obtained in above diameter classes for each species. Only two species Bambusa arundinacea and Dendrocalamus strirtus were found in Mysore District.

The following correlation factors were used for various, categom ries of culms to find out green weight of the bamboo culms.

Dry Sound Culm = $1 / 2$ Green Sound Culman
Dry Damaged Culm $=1 / 4$ Green Sound Culm.
Green Damaged Culm $=1 / 2$ Green Sound Culm.
Decayed Culm = O.

Applying the above factors to the green weight of bamboo culms and the total number of culms, the total bamboo stock (green weight) was estimated.

### 3.7.7 DRY WEIGHT EQUIVALENT OF BAMBOO STOCK:

Green weight of all the three 30 cms. pieces obtained from the top, middle and basal parts of utilizable culm of each species was recorded to the mearest 5 gms. for different diameter classes. Air dry weight (after 90 days or when the air dry weight of samples became constant) of the corresponding three pieces of each diameter class was taken. Utilizing this, a factor for dry weight correlation was developed. Using this factor, green tonnage was converted into dry tonm nage.

## CHAPTER -IV

## RESULTS DF THE INVENTORY

```
4.0 The results of the inventory have been presented here.
4.1 LAND USE PATTERN:
```

Utilization of the forest land and their extent under various categories were estimated by the total number of sample plots falling in that category multiplied by area weightage.

The details of land use pattern in the Surveyed area of Mysore district can be summarized as follows:

Table No. 1

| S.N. | La п d use | No. of plots. | Area in kme. | Parcentage |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 2 | 3 | 4 | 5 |
| 1. | Dense Tree Forests | 77 | 778.67 | 20.20 |
| 2. | Moderately Dense Tree Forests. | 164 | 1658.04 | 41:74 |
| 3. | Open Tree | 68 | 687.48 | 17.37 |
| 4. | Scrub Forests | 15 | 151.65 | 3.84 |
| 5. | Young crof of forestry | SFF.29 | 273.17 | 7.42 |
| 6. | Govt. grass lands | 2 | 20.22 | 0.51 |
| 7. | Barren lands | 2 | 20.22 | 0.51 |
| 8 | Agri, land without tree in surrounding. | 8 | 80.88 | 2.05 |

## L.AND USE PATTERN

| 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: |
|  | , |  |  |  |
| 9. | Agri. land with tree in surrounding. | 12 | 121.32 | 3.07 |
| 10. | Habitation | 1 | 10.11 | 0.26 |
| 11. | Water Bodies | 5 | 50.55 | 1.28 |
| 12. | Young Plantations | 4 | 40.44 | 1.02 |
|  | TOTAL | 391 | 3953.01 | 100.00 |

Out of 391 plots, 20 flots pertain to agri. lands, one plot each to habitation and barren land outside the R.F./P.F. boundary. Thus, the net forest area is represented by 369 plots equal to 3730.59 km 2. which is $94.37 \%$ of the area surveyed.

Net forest area is further classified into various categories which is given in the following Table (Table-2).

Tathe No. 2.

| S.N. | Net Forest Area | No. of plots | Area in乡me. | Percentae |
| :---: | :---: | :---: | :---: | :---: |
| 1. | Dense Tree Forests | 79 | 798.69 | 21.41 |
| 2. | Moderately Dense Tree | 164 | 1658.04 | 44.44 |
| 3. | Forests. <br> Open Tree forests | 68 | 687.48 | 18.43 |
| 4. | Scrub Forests | 15 | 151.65 | 4.07 |

| S.N. | Net Forest Area | No. of plots | Area in $K m^{2}$. | Percentae |
| :---: | :---: | :---: | :---: | :---: |
| 5. | Bamboo trakes | 2 | 20.22 | 0.54 |
| 6. | Young crop of forestry | 5pp.29 | 293.17 | 7.86 |
| 7 | Govt. Grass Lands | 2 | 20.22 | 0.54 |
| 8. | Barren Lands | 1 | 10.11 | 0.27 |
| 7. | Water Bodies | 5 | 50.55 | 1.36 |
| 10. | Young Plantations | 4 | 40.44 | 1.08 |
|  | Total | 367 | 3730.59 | 100.00 |

From the above it is clear that the dense tree forest, moderately dense tree forest constitutes $65.85 \%$ of the total net forest area. Thus, $65.85 \%$ of the area is having crown density varying from $30 \%$ to $70 \%$ and above.

It is also observed that the scrut forest categories constitute about $4.07 \%$ of the net tree forest which are subjected to heavy biotic interference.

About 18. $43 \%$ of the net forest area falls under the category of open forest with crown density varying from $5 \%$ to $29 \%$.

Qut of $3730.57 k m^{2}$ of met forest area, the tree forested areas constitute 3498.06 tme. the details are given in the following tatele.

| $5 . N .$ | Tree forested area | No. of plots. | $\begin{aligned} & \text { Area in } \\ & k m^{2} \end{aligned}$ | Average |
| :---: | :---: | :---: | :---: | :---: |
| 1. | Dense Tree forests | 79 | 798.69 | 22.83 |
| 2. | Moderately Dense tree forests. | 164 | 1658.04 | 47.40 |
| 3. | Dpen tree | 68 | 687.48 | 19.65 |
| 4. | Bamboo brakes | 2 | 20.22 | 0.58 |
| 5. | Young crop of forestry | $5 \text { PP. } 2 \overline{9}$ | 293.19 | 8.38 |
| 6. | Young plantations | $4^{1}$ | 40.44 | 1.16 |
|  | TOTAL : | 346 | 3498.06 | 100.00 |

It is clear from the above table that -
i) the major tree forested area constitutes the moderately dense forest accounting to $47.4-\%$;
ii) 2e. $83 \%$ of the tree forest area constitutes dense tree forest having the crown density 70\% and above;
iii) majority of the young crop of forestry speries and young planta tion constituting $9.5 \%$ of the tree forest area are having teak: as a main speries.

The division-wise breal: up of net forest area and tree forest area (wooded area) is given in Table 4 \& 5.

Table No. 4

| S.N. | Net forest area division wise. | No. of Plots | Area in $K m^{2}$. | Percentage |
| :---: | :---: | :---: | :---: | :---: |

## 4．2 LEGAL STATUS：

$97.56 \%$ of the met forest area comprises of Reserve．Forest and National Park．Dnly $0.54 \%$ are Protected Forest and $1.90 \%$ are Unclassed Forests．

The treak up of the forest area as per legal status is given in the table－t．

Table No． 6

| S．N． | Legal Status | No．of plots． | Area in トた $\pi^{2}$ 。 | Percentage |
| :---: | :---: | :---: | :---: | :---: |
| 1. | Reserved Forests | 243 | 2456．73 | 65.85 |
| 2. | Protected Forests | 2 | 20．22 | 0.54 |
| 3. | Unclassed Forests | 7 | 70.77 | 1.90 |
| 4. | National Park： | 117 | 1182.87 | 31.71 |
|  | TOTAL | 369 | 3730.59 | 100.00 |

4．3 The data regarding tarrain and soil are recordedfor the net forest area（excluding water bodies in forest area）whereas data such as crop composition，top height，size class，intensity of regeneration etc． are recorded for the plots falling in actual tree forest area．

## 4．4 TOPGGRAPHY DF THE FQREST AREA：

Majority of the forest area are found to be hilly and very hilly＂ $47.18 \%$ of the area comes under hilly category and $10.75 \%$ under
very hilly category. $39.29 \%$ of the area having gently rolling terrain and only $0.82 \%$ of the area is flat. The details of break up is given in the table-7.

Table No. 7

### 1.5 ROCKINESS:

The following table shows the status of rockiness in the forest area:

Table No. 8

| S.No. Rockiness | No. of plots Area in kmen Percentage |  |  |  |
| :--- | :--- | :---: | :---: | :---: |
| 1. | High | 2 | 20.22 | 0.55 |
| 2. | Medium | 43 | 434.73 | 11.81 |
| 3. | Low | 150 | 1516.50 | 41.21 |
| 4. | No rock: | 169 | 1708.59 | 46.43 |

46.43\% of the area falls under the category of NO ROCK and $41.21 \%$ of the area is LOW ROCKY. It in'dicates that sufficient soil cover exists in the surveyed area which can support forest cover.
4.6 STATE DF SUIL:

Soil depth, texture, consistency, humus, erosion status and coarse fragments indicate the state of soil in the forest area.
4.6.1 SOIL DEPTH:
$61.26 \%$ of the forest area is covered with medium and deep soil which indicates that it has potential to support deep rooted forest species.

Nearly $38.713 \%$ is covered with shallow and very shallow soil which can support shallow rooted species.

The details of areas covered under various soil depth categories are given in the following table:

Table No. 9
S.No. Soil depth

No. of plots Area in Fmき. Percentage -

| 1. | Very shalloow | 22 | 222. 42 | 6.04 |
| :---: | :---: | :---: | :---: | :---: |
| 2. | Shallow | 119 | 1203.07 | 32.67 |
| 3. | Medium | 178 | 1797.58 | 48.90 |
| 4. | Deep | 45 | 454.75 | 12.36 |
|  | TOTAL | 363 | 680.04 | 97.97 |

### 4.6.2 SOIL TEXTURE:

The texture of soil found in the forest area shows the following pattern:

Table No. 10.

### 4.6.3 SOIL CONSISTENCY:

The fattern of soil consistency in the forest area is as follows:
$\qquad$
S.No. Soil consistency

No. of plots Area in kme. Percentage

| Friahle | 5 | 50.55 | 1.37 |  |
| :--- | :--- | :---: | :---: | :---: |
| 2. | Slightly compact | 297 | 3002.67 | 81.59 |
| Compact | 62 | 626.82 | 17.03 |  |
|  |  | 364 | 3680.04 | 97.97 |

Majority of the area comes under slight compact category with $81.59 \%$ followed by compenct soil type with $17.03 \%$.
4.6.4 HUMUS:

Majority of the area are devoid of humus layer which is clear from the following table:

Tatle No. 12

| S.No. | H ume us | No. of pilots | Area in kme. | Percentage |
| :---: | :---: | :---: | :---: | :---: |
| 1. | Stal 10 w | 131 | 1334.41 | 35.97 |
| 2. | Medium | 59 | 596.49 | 16.21 |
| 3. | Deep | 9 | 90.97 | 2.47 |
| 4. | No humus | 165 | 1668.15 | 45.33 |
|  | TOTAL | 364 | 3680.04 | 100.00 |

```
4.6.5 EROSION STATUS:
    Erosion status of the forest area is indicated by the following
table:
```

    Table No. 13
    | S.No. | Soil Erosion | No. of plots | Area in kme. | Percentage |
| :---: | :---: | :---: | :---: | :---: |
| 1. | Heavy | 16 | 161.76 | 4.40 |
| 2. | Moderate | 118 | 1192.98 | 32.42 |
| 3. | Mild | 157 | 1587.27 | 43.13 |
| 4. | No erosion | 73 | 738.03 | 20.05 |
|  | TOTAL | 364 | 3680.04 | 100.00 |

It is seen that erosion occurring in the forest area is of mild ( $43.13 \%$ ) and moderate type (32. $42 \%$ ) and as sean that small percentage of the forest area (4.40\%) is heavily eroded. In $20.05 \%$ of the area there is no erosion.
4.6.6 COARSE FRAGMENTS:

Coarse fragments is absent in $44.51 \%$ of the forest arean State of coarse fragments is indicated in the following table:

Table No. 14
S.No. Coarse fragments

No. of plots Area in kme. Percentage

| 1. Loose stones | 21 | 212.31 | 5.77 |  |
| :--- | :--- | :--- | :--- | :--- |
| 2. | Gouldery | 93 | 940.23 | 25.55 |
| 3. Gravely | 88 | 889.68 | 24.51 |  |
| 4. No coarse fragments | 162 | 1637.82 | 44.51 |  |

### 4.7 ACCESSIBILITY OF THE AREA:

$94.23 \%$ of the area is having access to the road within 5 kms. from the forest. $\quad$ Due to accessibility within 5 kms. working operation can be smoothly handled. The following table indicates the extent of the area covered under different accessibility zone.

Table No. 15

| S.No. | Distance |  | Road | No. of plots | Area in $k \mathrm{~m}^{\mathbf{z}}$. | Percentage |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1. | Distance | 1 | KM | 165 | 1668. 15 | 45.33 |
| 2. | Distance | 1 | $\& 3 \mathrm{KM}$ | 132 | 1334.52. | 36. 26 |
| 3. | Distance | 3 | $\& 5 \mathrm{kM}$ | 46 | 465.06 | 12.64 |
| 4. | Distance | 5 | $\& 7 \mathrm{KM}$ | 12 | 121.32 | 3.30 |
| 5. | Distance | 7 | $\& 10 \mathrm{kM}$ | 5 | 50.55 | 1.37 |

Table No. 16
S.No. Drigin of stnad No. of plots Areain kmen Peregntage

| 1. | Natural forest of seed origin. | 329 | 3326.17 | 95.09 |
| :---: | :---: | :---: | :---: | :---: |
| 2. | Natural forest of coppice origin. | 1 | 10.11 | 0.29 |
| 3. | Man-made forest | 16 | 161.76 | 4.62 |
|  | TOTAL | 346 | 3498.06 | 100.00 |

### 4.9 CROP COMPDSITION:

The break up of crop composition is given below:

Tatle No. 17

| S.NO. | Crop composition | No. of plots | Area in km. | Percentage |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Teak: | 15 | 151.65 | 4.34 |
| 2. | Bamboo Forest | 2 | 20.22 | 0.58 |
| 3. | Miscellaneous | 329 | 3326.17 | 95.09 |
|  | TOTAL | 34.6 | 3498.06 | 100.01 |

95.07\% of the forest cover is of miscellaneous type. In the miscellaneous type teak is present in good proportion. $4.34 \%$ of the area is teak forest in which Teak is more than $20 \%$ in the crop composition.

Pure bamboo forest is negligible although bamboo is one of the important species which is extracted in the Mysore district.
4.10 CANOPY LAYER:

The area covered under various categories of canopy layer is indicated in the following table:

Table No. 18
S.No. Canopy layer/storey No. of plots Area in kme. Percentage

| 1. | No storey | 33 | 333.63 |  | 9.54 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 2. | One storeyed forest | 125 | 1263.75 |  | 36.13 |
| 3. | Two storeyed forest | 181 | 1829.91 |  | 52.31 |
| 4. | Three ar more storeyed | - 7 | 70.77 | 1 | 2.02 |
|  | TOTAL | 346 | 3498.06 |  | 100.00 |

Majority of the rerop (52.31\%)is two storeyed crop. $9.54 \%$ of the arée is having young crof in which canopy formation has not taken place.

## SIZE CLASS:

The trees in the sample plots were categorised according to their timber utility. The different size classes adopted in the present study depending upon predominance of diameter classes are as follows:

## Diameter class

a. Regeneration
b. Polecrop
c. Small timber
d. Big timber
e. Mixed size class

10 cm.
10-20 cm.
20-30 cm.
30 cm. and above.
Tree crop with no marked domination of any size class.

The following table shows the crop of odifferent size classes and extent of areas represented by them.

Table No. 19
S.No. Sizeclass . No. of plots Areain kme. Percentage

| 1. | Regeneration | 37 | 374.04 | 10.69 |
| :--- | :--- | :---: | :---: | :---: |
| 2. | Pole crop | 127 | 1283.97 | 36.71 |
| 3. | Smalltimber | 84 | 849.24 | 24.28 |
| 5. | Bigtimber | 36 | 363.96 | 10.40 |
|  |  | 62 | 626.82 | 17.92 |

It is seen that pole crof is occupying $36.71 \%$ while smảll timber occupies only $24.28,10.67 \%$ comes under the regeneration class.

### 4.12 <br> TOP HEIGHT:

The top height is arrived by taking the average height of dominant trees occurring in the plot or in the surrounding area of 2 ha.

The following table indicates the distribution of the crof area under different top rieight classes:
S.No: Top height

No. of plots Area in kme. Percentage

| 1. $0001-0005 \mathrm{M}$ | 20 | 202.20 | 5.78 |  |
| :--- | :---: | :---: | :---: | :---: |
| 2. | $0006-0010 \mathrm{M}$ | 108 | 1091.88 | 31.21 |
| 3. | $0011-0015 \mathrm{M}$ | 114 | 1152.54 | 32.75 |
| 5. | $0016-0020 \mathrm{M}$ | 51 | 515.61 | 14.74 |
| 6. | $0021-0025 \mathrm{M}$ | 34 | 343.74 | 9.83 |
| 7. | 18 | 181.98 | 5.20 |  |
|  | $0026-0030 \mathrm{M}$ | $1-0040 \mathrm{M}$ | 346 | 3498.06 |

It is seen from the above that forest is three storeyed in which lower storey ranges from ito 10 mm consisting of $37 \%$ of the crop, the midde storey ranging fromi 11 to 25 m m constitutimy $57.5 \%$ and the tof canopy ranging from 26 to $40 \mathrm{~m} . \operatorname{constituting~about~} 5.5 \%$ of the crop.

## 4. 13 REGENERATION STATUS:

Regeneration status for economically important sfecies was considered. Established regeneration of all sample trees (diameter of 2 to 10 cm. at breast height) in a plot of $4 \mathrm{M} \times 4 \mathrm{M}$ laid at the centre of the sample flot was counted. The different categories are -
S.N.

5 t atus
Regenération

| 1. | Adsquate | 8 or more seedlings. |
| :---: | :---: | :---: |
| 2. | Inadequate | Ufito 8 seedlings. |
| 3. | Absent | No regeneration. |

The following table shows the intensity of regeneration in the surveyed area:

## Table No. 21

S.No. Intensity of regeneration No. of plots Area in kme. Percentage

| 1. | Adequate | 42 | 424.62 | 12.14 |
| :---: | :---: | :---: | :---: | :---: |
| 2. | Inadequate | 220 | 2224.20 | 63.58 |
| 3. | Absent | 71 | 717.81 | 20.52 |
| 4. | Not recorded | 13 | 131.43 | 3.76 |
|  | TOTAL | 346 | 3498.06 | 100.00 |

It is seen that vast extent of forest area i.e. $34,10 \%$ of the area is either having inadequate regeneration or devoid of any regeneration. Only $12.14 \%$ of the forest area is having adequate regeneration.

The extent of forest area subjected to various kind of injuries is indicated below:

| S.NO. | Injuries to crop | Non of plots | Area in kme. | Percentage |
| :---: | :---: | :---: | :---: | :---: |
| 1. | Girdling and illicit felling. | 115 | 1162.65 | 33.24 |
| 2. | Lopping for fodder | 7 | 70.77 | 2.02 |
| 3. | Qther injuries | 76 | 768.36 | 21.97 |
| 4. | No injury | 148 | 1496.28 | 42.77 |
|  | TOTAL | 346 | 3498.06 | 100.0 |

$42.77 \%$ of the area is not subjected to any kind of injury* This may be due to the fact that such areas are falling under National Parks or Sanctuary where strict restrictions are being implemented. .
$33.24 \%$ of the forest area is sutjected to girdling and illicit felling which amount to about $1 / 3$ of the forest area. In the categories of other injuries constituting $21.77 \%$ it may be due to wild life damages.
4.15 FIRE INCIDENCE:

The details of the forest covered under fire incidence are indicated below.

| S.No. Fireincidence | No. of plots | Area in kme. Fercentage |  |  |
| :--- | :--- | :---: | :---: | :---: |
| 1. | Heavy | 3 | 30.33 | 0.87 |
| 2. | Moderate | 18 | 181.98 | 5.20 |
| 3. | Light | 177 | 1789.47 | 51.16 |
| 4. | Nofire | 148 | 1496.28 | 42.77 |
|  | TOTAL | 496 | 3498.06 | 100.00 |

Major portion of the forest area comes under deciduous and moist deciduous type where fire occurrence is common. In most of the forest only ground fire takes place which amount to light in the nature. Such areas are accounting to $51.16 \%$. In $42.77 \%$ of the area no fire incidence was noticed which may be due to strict regulations in National Parks and Sanctuaries forming bulk of area in the district.
4.16 GRAZING INCIDENCE:

The following table shows the grazing incidence in the forest area.

Tatle No. 24
S.No. Grazing incidence No of plots Area in kme. Percentage

| 1. Heavy | 61 | 616.71 | 17.63 |
| :--- | :--- | ---: | ---: | ---: |
| 2. Moderate | 49 | 495.39 | 14.16 |
| 3. Light | 103 | 1041.33 | 29.77 |
| 4. No grazing | 133 | 1344.63 | 38.44 |
|  | 346 | 3498.06 | 100.00 |

It is seen that grazing in different intensities occurs in $61.55 \%$ of the area, out of which $17.63 \%$ of the area is heavily grazed. Grazing has a direct impact on the regeneration status. It also renders the soil compact. Intensity of grazing is heavier in kollegal forest Division and fortion of Mysore and Hunsur Divisions nearer to habitation.
4. 17 PRESENCE OF WEEDS:

In $97.42 \%$ of forest area occurrence of weeds was noticed. The following table inditate the presence of weeds in the area.

Table No. 25

| S.No. | Presence of weeds | No. of plots | Area in kme. | Percentage |
| :---: | :---: | :---: | :---: | :---: |
| 1. | Very dense | 48 | 485.28 | 13.87 |
| 2. | Dense | 98 | 990.78 | 28.32 |
| 3 | Moderate | 87 | 879.57 | 25.14 |
| 4. | Scanty | 111 | 1122.21 | 32.08 |
| 5. | Absent | 2 | 20.22 | 0.58 |
|  | TOTAL | 346 | 3498.06 | 97.79 |

In $97.69 \%$ of the area presence of grass was moticed. In $47.11 \%$. presence was scanty. The details of area in which presence of grass was noticed are given below:

Table No.2t.

| S.No. Presence of grass | No. of Plots | Area in Km. Percentage |  |  |
| :--- | :--- | :---: | :---: | :---: |
| 1. | Very dense | 35 | 353.85 | 10.12 |
| 2. | Dense | 47 | 475.17 | 13.58 |
| 3. | Moderate | 93 | 940.23 | 26.88 |
| 4. | Scanty | 163 | 1647.93 | 47.11 |
| 5. | Absent | 8 | 80.88 | 2.31 |

### 4.19 PLANTATION POTENTIAL:

Plantation potential in the entire forest land was assessed by considering the land class to which the sample plot laid out belongs. While deciding this, other factors such as aspect, soil depth, drainage, crop in surrounding area and other biotic, climatic factors were considered. All those forests where the crown density is $30 \%$ or more, plantation potentil is not of any significance and such area has been put under - Not applicable" category. The following table gives the plantation

Table No. 27.

| S.No. Plantation potential | No. of plots | Area in kme. Percentage |  |  |
| :--- | :--- | :---: | :---: | :---: |
| 1. | Plantable | 71 | 717.81 | 17.51 |
| 2. | Unplantable | 11 | 111.21 | 3.02 |
| 3. . Not applicable | 282 | 2851.02 | 77.47 |  |
|  | ToTAL | 364 | 3680.04 | 100.00 |

The table shows that $17.51 \%$ of the area admeasuring 717.81 kme. is having potential for plantation which should be given consideration while preparing the future plan.

The enrichment plantations are being attempted in some of those areas also where crown density is above $30 \%$.
4.20 STATE DF FOREST (Degradation):

The extent of degradation of the forest area was judged from two angles, one is based upon the natural calamities such as landslide, flood, rainfall etc. and other is based upon human factors like grazing, fire, pollarding, illicit cutting and topping.

The following table indicates the status of the forest in both the categories.

Table No. 28

| S.No. | Degraded forests <br> to human factors) | No. of plots | Area in kme. Percentage |  |
| :--- | :--- | :--- | :--- | :--- |
| 1. | Heavily degraded | 39 | 394.29 | 11.27 |
| 2. | Moderately degraded | 40 | 404.40 | 11.56 |
| 3. | Mildly degraded | 85 | 859.35 | 24.57 |
| 4. | Not degraded | 182 | 1840.02 | 52.60 |
|  | ToTAL | 346 | 3498.06 | 100.00 |

Table No. 29
S.No. Degraded forests (due No. of plots Area in kime Percentage to natural calamities).

| 1. Moderately degraded | 2 | 20.22 | 0.58 |  |
| :--- | :--- | ---: | ---: | ---: |
| 2. Mildly degraded | 47 | 475.17 | 13.58 |  |
| 3. | Not degraded | 297 | 3002.67 | 85.84 |
|  | 346 | 3498.06 | 100.00 |  |

It is seen that about half of the area is not degraded by human interference. This may be due to the fact that regulations are strictly enforced in the National Park and Sanctuary areas.

It is seen that the natural calamities have not affected the forest area considerably and about $86 \%$ of the area is not degraded.

### 4.21 OCCURRENCE OF BAMBOD: 4.21.1 BAMBOO DENSITY:

The following tatle indicates the density of bamboo in the
forest area:

Tatle No. $30^{2}$

| 5.No. | Bamboo density No. | f Plots | Area in kima | Percentage |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 2 | 3 | 4 | 5 |
| 1. | Pure bamboo | 1 | 10.11 | 0.29 |
| 2. | Very dense | 6 | 60.66 | 1.73 |
| 3. | Dense | 13 | 131.43 | 3.76 |
| 4. | Moderately dense | 14 | 141.54 | 4.05 |
| 5. | Scattered | 20 | 202.20 | 5.78 |
| 6. | Sparse | 52 | 525.72 | 15.03 |
| 7. | Bamboo present but clumps completely hacked by people. | 5 | 50.55 | 1.45 |
| 8. | No bamboo | 209 | 2112.99 | 60.40 |
| 9. | Regeneration crop | 26 | 262.86 | 7.57 |
|  | total | 346 | 3498.06 | 100.00 |

$60.40 \%$ of the forest area is devoid of bamboo. The area covered under the bamboo is $1385.07 \mathrm{~km} \mathrm{~m}^{\mathbf{2}}$. out of which 262.86 kme . is regeneration crop. Occurrence of bamboo is mostly sparse and scattered. Only about $6 \%$ of the forest area is fiaving dense bamboo

### 4.21.2 BAMBOO QUALITY:

The bamboo areas were classified into bamboo site quality classes. For the purpose, the average of measurements of tallest culms
occurring in 2 ha, were taken into account. Quality classes were determimed as per the average height in the following manner.

| Quality class | Average culm height |
| :---: | :---: |
| I | 6 metre or more for Dendrocelamus strictus. 14 metre or more for Bambusa arundinacea. |
| I I | 4 metres or more but less than 6 metres for Dendrocalamus strictus. 10 metres or more but less than 14 metres forBambusa arundinaceas |
| III | 2 metres or more tut less than 4 metres for Dendrocalamus strictus. <br> 2 metres and more but less than 10 metres for Bambusa arundinaceg. |

The following table gives the occurrence of bamboo in different quality classes in the forest area.

Table No. 31

| S.No. | Bamboo quality | No. of plots | Area in kme. | Percentage |
| :---: | :---: | :---: | :---: | :---: |
| 1. | First | 75 | 758.25 | 54.74 |
| 2. | Second | 12 | 121.32 | 8.76 |
| 3. | Third | 24 | 242.64 | 17.52 |
| 4. | Not applicable (Regeneration crop) | 26 | $262.86$ | $19.98$ |
|  | TOTAL | 137 | 1385.07 | 100.00 |

It is seen that majority of the area covered under bamboo contains quality-I bamboo which comes to $54.74 \%$ Percentage of quality II \& ItI romes to $8.76 \%$, $17.52 \%$ respectively. $17.98 \%$ area is having regeneration crop only.

### 4.21.3 BAMBOD FLDWERING:

Flowering has not occurred in $86.86 \%$ of the bamboo area while in $13.14 \%$ of the area sporadic flowering was notiged. The following table indicates the flowering status:

Table No. 32

| S.No. | Bamboo flowering | No. of plots | Area in kmt ${ }^{\text {a }}$ | Percentage |
| :---: | :---: | :---: | :---: | :---: |
| 1. | Sproradic | 18 | 181.98 | 13.14 |
| 2. | No flowering | 119 | 1203.07 | 86.86 |
|  | TOTAL | 137 | 1385.07 | 100.00 |

### 4.21.4 BAMBDC REGENERAT IDN:

The following table indicates the regeneration status of bamboo in the forest area.

Table No. 33

| S. No. | Bamboo regeneration | No. of plots | Area in kme Percentage |  |
| :--- | :--- | :--- | :--- | :--- |
| 1. | Dense | 1 | 10.11 | 0.73 |
| 2. Medium | Scattered | 30 | 303.30 | 21.90 |
| 4. | 92 | 930.12 | 67.15 |  |
|  | 14 | 141.54 | 10.22 |  |

It is seen that in 67. 15\% of the bamboo area; regeneration is scattered and in $21.90 \%$ of the area is covered with medium regeneration.

Only 0.73\% of the area is having dense regeneration. Regeneration is atsent in 10.22\% of the area.

## 4.2こ GROWING STOCK:

4.22.1 GROWING STAND (STEM):

The following table gives the number of stems in various categories as indicated below:

Table No. 34

| S.N. | Crop composition. | No. of sample points. | Area in sq. km. | Stem/ha. | Total No. of stems. | Percentage |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1. | Teak | 15 | 151.65 | 218.667 | 3316080 | 5.70 |
| 2 | Bamboo | 2 | 20.22 | 75.00 | 151650 | 0.26 |
| 3. | Miscellaneous. | 327 | 3326.19 | 164.62 | 54755760 | 94.04 |
|  | TOTAL | 346 | 3498.06 | 166.445 | 58223490 | 100.00 |

The total number of stems in the tree forest area is $5,82,23,490$ with an average of about 166 stem per hectare. $94 \%$ of the crop falls under miscellaneous category.

The following tatle gives the number of stems/ha. and total number of stems of each species present in the Mysore forest:

Table No. 35

| S1.No. | Name of speries | $\begin{aligned} & \text { No. of } \\ & \text { Stem/ha. } \end{aligned}$ | Total no. of stem. | Percentage |
| :---: | :---: | :---: | :---: | :---: |
| 1. | Anogeissus latifolia | 33.410 | 11687960 | 20.07 |
| 2. | Terminalia crenulata | 13.353 | 4670820 | 8.02 |
| 3. | Tectona grandis | 10.607 | 3710370 | 6.37 |
| 4. | Hardwickia binata | 9.191 | 3214980 | 5.52 |
| 5. | Grewia tieliaefolia | 6.185 | 2163540 | 3.72 |
| 6 | Pterocarpus marsupium | 5.434 | 1700680 | 3.26 |
| 7. | Dalbergia latifolia | 3.584 | 1253640 | 2.15 |
| 8. | Terminalia paniculata | 2.137 | 748140 | 1.25 |
| 9. | Boswellia serrata | 2.023 | 707700 | 1.22 |
| 10. | Diospyros melanoxylon | 0.54 .7 | 192090 | 0.33 |
| 11. Schle | ichera trijuga/oleosa | 0.520 | 181980 | 0.31 |
| 12. | Lagerstroemia lanceolata | 0.318 | 111210 | 0.19 |
| 13. | Santalum album | 0.116 | 40440 | 0.07 |
| 14. | Vitex altissima | 0.029 | 10110 | 0.02 |
| 15. | Rest of species | 78.988 | 27630630 | 47.46 |
|  | TOTAL |  | 58223490 | 100.00 |

The three species Anogeissus latifolia, Tectona grandis and Terminalia crenulata comprise one third of the total growing stand. Dut of $5,82,23,470$ stems, Anogeissus latifolia has a tally of $1,16,87,160$, (20.7\%) Teak $37,10,37(6.37 \%$ ) and Terminalia crenulata has 46,70,820 (8.02\%). Dut of toal 66.445 stem/ha, 33.41 stems belong to Anogeissus latifolia, 13.353 to Terminalia erenulata and 10.60 to Tectona grandis. $68.67 \%$ of the crop falls in the diameter class 10-20 $\quad 6 m$ and $86.71 \%$ of the crop is distributed upto $25-30$ cm. diameter class.

The sandalwood population in the district is $0.07 \%$ of the total number of stems. The total number of stems comes to 40,440 according to the survey which are of 10 cms. diameter and above. The diameter class wise details have been enclosed in Anחexurewis II.

The following tatle indicates the number of stems/ha and total number of stemin each Forest Division.. oc

Table No. 36
S.N: Forest Division No. of Area in Total No. No. of Fercentage $\begin{aligned} & \\ & \text { sample kme. } \\ & \text { Flots. }\end{aligned}$

| 5. | Bandipur Tiger Project | 77 | 798.69 | 14790930 | 185.170 | 25.40 |
|  | TOTAL | 346 | 3498.06 | 58223490 | 166. 445 | 100.00 |

The table indicating divisionwise growing stand for various species in different dia-classes have been enclosed in Annexure-IX \& XVIII.

## CROP COMPDSITION - TEAK FOREST:

In Teak stratum, it is found that out of 3316080 stems, Teak has tally of $940230(28.35 \%)$ stems followed by Anoreissus latifoliag with 738030 stems. Ierminalia crenulata with 293190, Dalberaia latifolia with 141540 stems. The rest of the sfecies put together constitute about 930120 stems in this stratum (about $28.08 \%$ ). The following table shows the number of stems and stem/ha sfecies wise in Teak stratum.

DIVISION WISE POSITION OF GROWING STAND B GROWING STOCK

Growing stock $\mathrm{M}^{3} / \mathrm{ho}$

## Tatie No: 37

| S.N. | Species Name | Stem/tia. | Total No. | Percentage |
| :---: | :---: | :---: | :---: | :---: |
| 1. | Tectona grandis | 62.000 | 940230 | 28.35 |
| 2. | Anogeissus latifolia | 48.667 | 738030 | 22.26 |
| 3. | Terminalia crenulata | 19.333 | 293190 | 8.84 |
| 4. | Dalbergia latifolia | 9.333 | 141540 | 4.27 |
| 5. | Grewia tiliaefolia | 6.667 | 101100 | 3.05 |
| 6. | Pterocarpus marsupium | 5.333 | 80880 | 2.44 |
| 7. | Lagerstroemia lanceoilata | 2.667 | 40440 | 1.22 |
| 8. | Schleichera trijuga | 2.000 | 30330 | 0.91 |
| 9. | Terminalia paniculata | 1.333 | 20220 | 0.61 |
| 10. | Rest of the species | 61.333 | 930120 | 28.08 |

From the above table it is seen that $50 \%$ of the total stems comprises of Tectona grandis and Anogeissus latifolia. The details of growing stand in differnet diameter classes have been given in Annexure III \& IV.

About one third of the stems falls in the category of 10 - 15 cms. diameter class. $75.6 \%$ of the crop is distrituted upto 25-30 cms. diameter classes.

## CROP COMPOSITIDN - BAMBCD FBREST:

In bamboo forest it is found that out of 151650 stems, Dalbergia latifolia has 70770 stems which is $46.67 \%$ of the total stem in bamboo stratum. Pterocarpus marsupium and Santalum altum has each 20220 stems(13.33\%) followed by Grewia tieliaefolia and Terminalia crenulata each having 10110 stems $(6.67 \%$ ). The rest of the species put together
constitute about 20220 stems (13.33\%) in the stratum.

The following table shows the number of stems per ha. and the total number of stems of each species in Bamboo stratum

## Table No. 38

| S.N. | Species name | No. of stem/tıa. | Total Rercentage of stem. |  |
| :---: | :---: | :---: | :---: | :---: |
| 1. | Dalbergia latifolia | 35 | 70770 |  |
| 2. | Grewia tieliaefolia | 5 | 10110 | 6.6.67 |
| 3. | Pterocarpus marsupium | 10 | 20220 | 13.33 |
| 4. | Santalum altum | 10 | 22220 | 13.33 |
| 5. | Terminalia crenulata | 5 | 10110 | 6.67 |
| 6. | Rest of the speries | 10 | 20220 | 6.37 13.33 |

The details of growing stand in different diameter classes have been given in Annexure - $V$ s $V I$. The two third of the crop is found to be in 10-15 cms. diameter class.

## CROP COMPOSITION OF MISCELLANEOUS FOREST:

Out of 54755760 stems in the miscellaneous stratum, 20\% is Anogeissus latifolia followed by Terminalia crenulata with $8 \%$, Hardwickia binata with $5.87 \%$ and Tectona grandis with $5.06 \%$

The species wise number of stems per ha. and total number of stems in the miscellaneous forest is given below:

Table No. 39

| S.N. | Species Name | No. of |
| :--- | :--- | :--- | :--- | :--- |
| stems/ha | Total <br> No. <br> stef | Percentage |

| 10. | Schleicheratrijuga/oleosa | 0.456 | 151650 | 0.28 |
| :--- | :--- | ---: | ---: | ---: |
| 11. | Tectonagrandis | 8.328 | 2770140 | 5.06 |
| 12. | Terminaiiacrenulata | 13.131 | 4367520 | 7.98 |
| 13. | Terminaliaqaniculata | 2.188 | 727920 | 1.33 |
| 14. | Vitexaltissima | 0.030 | 10110 | 0.02 |
| 15. | Restofspecies | 80.213 | 26680290 | 48.73 |

The details of growing stand in different diameter classes have been given in Annexure-VII \& VIII.

About half of stem (49\%) is of the 10-15 cm. diameter classes $87 \%$ of the cropis distributed upto 25-30 cms. diameter classes.

Anogeissus latifolia is the major species in this stratum having 32.918 stems per ha.

### 4.22.2 GRDWING STOCK (VOLUME):

Growing stock has been estimated for different crop composition stratum in terms of volume per hectare and total volume. The following table indicates the growing stock in different stratuma

Table No. 40

| S.N. | Crop composition. | No. of sample plots. | Area in $k m^{2}$. | Volume/han in $\mathrm{m}^{3}$. | Total volume in $\pi^{3}$. | Percentage |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1. | Teal: | 15. | 151.651 | 102.613 | 1556131 | 8.25 |
| 2. | Bamboo | 2 | 20.22 | 11.02 | 22281 - | 0.12 |
| 3. | Miscellaneous | 34 | 3326.17 | 51.959 | 17282437 | 91.63 |
|  | TOTAL | 346 | 3498.06 | 53.718 | 18860869 | 100.00 |

The following table indicates the growing stock in each forest Division.

| S.N. | Forest Division | Non of Area sample in plots. km. |  | Total arowing stock: (volume) in $\mathrm{m}^{3}$. | ```Growing stock/ ha. in m``` | Percentage |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| .152 |  |  |  |  |  |  |
| 1. | Hunsur | 18 | 181.78 | 1007689 | 55.374 | 5.34 |
| 2. | Mysore | 38 | 384.18 | 3087561 | 80.368 | 16.37 |
| 3. | Chamrajnagar | 46 | 465.06 | 2433263 | 52.321 | 12.70 |
| 4. | Kollegal | 165 | 1668.15 | 6145256 | 36.837 | 32.50 |
| 5 | Bandipur Tiger Project. | 79 | 778.69 | 6187101 | 77.466 | 32.81 |
|  | TOTAL | 346 | 3473.06 | 18860867 | 53.718 | 100.00 |

After comparing this table with table No. 36 ; it is found that although Kollegal Forest Divisjon contains $44.30 \%$ of the growing stand of the district, it has $32.58 \%$ of the growing stock in terms of volume, while Mysore arid Bandifur Tiger Project Divisions containing 12. $59 \%$ and $25.40 \%$ of the growing stand respectively have $16.37 \%$ and $32.81 \%$ of the total growing stock in terms of volume.

This shows that Kollegal Forest Division contains inferior forest as compared to Mysore and Eandipur Tiger Project Divisions.

The details of the Division-wise growing stock of varioius species in different diameter classes have been given in Annexure-XXVII to $X X X V I=$

## TOTAL VOL_UME AMD VDLUME PER HECTARE:

Table Non 42 shows the total volume distritution and volume per hectare in the mysore district. It shows that out of total volume of
$18860869 \mathrm{cu} . \mathrm{mtr}$. Anogeissus latifolia has a volume of 3261483 mb which is $17.3 \%$ followed by Tectona arandis with $13.47 \%$ and Terminalia frenulata with $12.11 \%$.

## Table No. 42

| S.N. | Species Name | $\begin{gathered} \text { Total volume } \\ \text { in } m^{3} \text {. } \end{gathered}$ | Volume/ トa. | Percentage |
| :---: | :---: | :---: | :---: | :---: |
| 1. | Anogeissus latifolia | 3261483 | 9.32 .4 | 17.30 |
| 2. | Tectona grandis | 2540894 | 7.264 | 13.47 |
| 3. | Terminalia crenulata | 2284827 | 6.532 | 12.11 |
| 4. | Pterocarpus marsupium | 1197992 | 3.43 | 6.36 |
| 5. | Hardwickia binata | 655064 | 1.873 | 3.47 |
| 6. | Grewia tiliaefolia | 629376 | 1.799 | 3.34 |
| 7. | Dalbergia latifolia | 516700 | 1.477 | 2.74 |
| 8. | Schleichera trijugadoleosa | 426092 | 1.218 | 2.26 |
| 9. | Terminalia paniculata | 226283 | 0.647 | 1.20 |
| 10. | Boswellia serrata | 122197 | 0.349 | 0.65 |
| 11. | Diospyros melanoxylon | 18548 | 0.053 | 0.10 |
| 12. | Lagerstromia lanceolata | 90225 | 0.258 | 0.48 |
| 13. | Vitex altissima | 5586 | 0.016 | 0.03 |
| 14. | Rest of the species | 6880803 | 19.670 | 36.49 |

The details of the growing stock in various diameter classes have been given in Annexure XIX \& $X X$.

Out of 53.718 m3/ha. Anogeissus latifolia contributed 9.324 m3/ha. On comparing the fosition of various species in Table No. 35 where Anogeissus latifolia stood first both in terms of stem and stems/ha. and total volume and volume/ha., whereas although Terminalia crenulata has more number of stems and swems/ha. but in volume it stand third after fectona grandis. The reason behind it is that although the number of stems is more in case of Ierminalia crenulata these are more spread in lower diameter classes.

The following table shows the total volume distribution and volume/ha $1 \pi$ Teak stratum (area 151.6S kmi.). It indicates that out of total volume of 1556131 m3. Teak has a volume of 781459 m3 which is about $50.22 \%$, followed by Anogeissus latifolia with $16.07 \%$.

Table No. 43

| S.N. | Species Name $\quad$ Tot | Total volume in $\pi^{3}$. | Volume/ ha. | Percentage |
| :---: | :---: | :---: | :---: | :---: |
| 1. | Tectona grandis | 781459 | 51.53 | 50.22 |
| 2. | Anogeissus latifolia | 250081 | 16.471 | 16.07 |
| 3. | Dalbergia latifolia | 83712 | 5.52 | 5.38 |
| 4. | Terminalia crenulata | 72507 | 4.781 | 4.66 |
| 5. | Schleictiera trijuga/oleosa | 62491 | 4.121 | 4.02 |
| 6. | Pterocarpous mersupium | 48710 | 3.212 | 3.13 |
| 7. | Grewia tiliaefolia | 43091 | 2.841 | 2.77 |
| 8. | Lagerstroemia lanceolata | 31628 | 2.086 | 2.03 |
| 9. | Terminalia paniculata | 11077 | 0.730 | 0.71 |
| 10. | Rest of the speries | 171377 | 11.301 | 11.01 |

The diameter class wise details of the above have been given in Annexure XXI \& XXII.

After comparing tife Table No. 43 with Table No. 37 , it is clear that although Teak has $28.35 \%$ of the total number of stems, in terms of volume, it has $50.22 \%$ of the growing stock. It is due to the reason that Teat: crop is well distributed in higher diameter classes while other species are more distributed towards lower diameter classes. Similarly due to the same reason although in terms of number of stems, Terminalia crenulata is above the Dalbergia latifolia, the former contains less volume than the latter.

## CROP COMPOSITIDN BAMBCO:

The following table gives the volume distribution and volume per ha. in Bamboo stratum (tree: $20.22 k m^{2}$ ).

Table No. 44

| S.N. | Name of species | $\begin{gathered} \text { Total volume } \\ \text { in } \pi^{3} \text {. } \end{gathered}$ | Volume/ <br> han in $\pi^{3}$. | Percentage |
| :---: | :---: | :---: | :---: | :---: |
| 1. | Dalbergia latifolia | 10684 | 5.284 | 47.94 |
| 2 | Grewia tieliaefolia | 1661 | 0.822 | 17.46 |
| 3. | Santalumı album | 1520 | 0.751 | 6.81 |
| 4. | Terminalia crenulata | 1416 | 0.701 | 6.36 |
| 5. | Pterocarpous marsupium | 1164 | 0.576 | 5.23 |
| 6. | Rest of species | 5837 | 2.887 | 26. 20 |

The details of the growing stock present in various diameter classes have been given in Annexure XXIII \& XXV.

Daltergia latifolia is the major component in this stratum containing $47.94 \%$ of total growing stock followed by Grewia tiliaefolia. Santalum album, Terminalia crenulata and pterocarpus marsupium having $17.46 \%$ to $5.23 \%$ of the growing stock.

## CROP CDMPOSITIDN MISCELLANEDUS:

The volume distribution of various species in the miscellaneous forest is indicated in the following table:

Table No. 45 .

| S.N. | Spegies Name T | $\begin{gathered} \text { Total vplume } \\ \text { in } m^{3} \end{gathered}$ | $\begin{aligned} & \text { Volume/f } \\ & \text { in } m^{\mathbf{B}} \end{aligned}$ | percentage |
| :---: | :---: | :---: | :---: | :---: |
| 1. | Anogeissus latifolia | 3011402 | 9.054 | 17.43 |
| 2. | Terminalia crenulata | 2210902 | 6.647 | 12.79 |
| 3. | Tectona grandis | 1757435 | 5.290 | 10.10 |
| 4. | Pterocarpus mersupium | 1150117 | 3.458 | 6.66 |
| 5 | Hardwickia bimata | 655064 | 1.969 | 3.79 |
| 6. | Grewia tiliaefolia | 584624 | 1.758 | 3.38 |
| 7 | Dalbergia latifolia | 422304 | 1.270 | 2.44 |
| 8. | Gehleichera trijuga/oleosa | - 363601 | 1.093 | 2. 10 |
| 7. | Termjnalja faniculata | 215207 | 0.647 | 1.25 |
| 10. | Boswellia serrata | 122197 | 0.367 | 0.71 |
| 11. | Lagerstroemia lanceolata | 58597 | 0. 176 | 0.34 |
| 12. | Diospyros melanokylon | 18548 | $0.056$ | $0.11$ |
| 13. | Vitex altissinta | 5586 | 0.017 | 0.03 |
| 14. | Santalum album | 1281 | 0.004 | 0.01 |
| 15. | Rest of sfecies | 6703570 | 20.154 | 38.78 |
|  | About 40\% of the growing stock is comptised of |  |  | species, |
| namely | Anopeissus latifolia | Termina | Erenul | . $77 \%$ ) and |
| Tectona | grandis (10.18\%) |  |  |  |

Contribution of Sandal wood to growing stock is negligible. This point is worth noting becuase of the fact that this district is considered to have good Sandal wood forest.

Table showing the growing stock under different diameter classes have been enclosed in Annexure-xXV \& XXVI.

### 4.22.3 GROWING STDCK BAMBDOS:

The following table gives the distribution of bamboos by sfecies and quality class in the suryeyed area :

The fallowing table gives the distribution of bamboos by species and quality class in the surveyed area:

Table No. 46

Thus, out of total area under bamboo, $17 \%$ are covered with BambuSa arundinacea and $83 \%$ are with Dendrocalamus strictus. Dut of quality-I area $80 \%$ are covered with Dendracalamus strictus while 20\% are covered with Bambusa arundinacea. The percentage of quality II \& III are covered under. Dendrogalamus strictus is 72 and 87.5 respectively, while Bambusa arundinacea occupies $8 \%$ of the quality-II area and $12.5 \%$ of the qualityIII area.

## BAMBDD STOCK BY WEIGHT

The average height and weight of a sound green culmin diameter
 out from the data recorded in Bamboo Weight Form which is presented Eelow:

Table No. 47

| S.N. | Species Name | Culm dia. class. | Average height of culmin metre. | Average green weight of a culminkg. | Average air dry weight of a culmin kg. | Average air dry weight as a culm percentage of the average green weight. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1. Bambusa arundinacea. |  | $\begin{aligned} & 2 \mathrm{~cm} \text { to }<5 \\ & \mathrm{~cm}, \\ & 5 \mathrm{~cm} \text { to }<8 \\ & \mathrm{~cm} . \\ & 8 \mathrm{~cm} \& \text { above } \end{aligned}$ | 6.186 | 4.838 | 1.979 | 40.905 |
|  |  | 8.550 | 17.311 | 6.681 | 38.594 |
|  |  | 20.000 | 46.79 | 28.444 | 60.791 |
| 2. Dendrocalamus strictus. |  |  | $\begin{aligned} & 2 \mathrm{~cm} \text { to }<5 \\ & \mathrm{~cm} . \\ & 5 \mathrm{~cm} \text { to }<8 \\ & \mathrm{~cm} . \end{aligned}$ | 5.276 | 3,915 | 2.017 | 51.520 |
|  |  | 6.15 |  | 12.339 | 6.644 | 53.846 |
|  |  | 8 cmas above | 0.00 | 0.000 | 0.000 | 0.000 |

Here utilizable length reckoned upto 1 cm. culm diameter only. The above data has been used for calculating the bamboo stock of weight in the surveyed area. The results have been enclosed in the AnnexureXLIV \& XLV.

From the result the total bamboo stock (Green Weight) comes to 137844 tonnes and its dry equivalent weight is 23518 tonnes. It is also seen that about $17.28 \%$ of the total bamboo stock consists of dry culms. Dut of the balance 114026 tonnes about $31.72 \%$ or 36164 tonnes are damaged, which is indicative of the considerable biotic and wild life pressure on the bamboo in the district.

It is also seen that 30370 tonnes out of the 137844 tonnes of the green bamboo stock inen, 2e\% consists of current year culm. Therefore, $i t$ can be concluded that the surveyed area can yield 30370 tonnes of bamboos per year if due attention on careful nurtiring of the stofk is biven and the dry and decayed bamboos are timely removed to eliminate fire hazards.

### 4.23 STANDARD ERROR:

Standard error is a useful indicator of the error involved in estimating the various parameters. It expresses the error as a fercentape of the mean value of the parameter. The following tables indicate the size of the error when the surveyed area is attempted to be stratified in different ways.

## Table No. 48
